IMPORTANT CONSIDERATIONS

GRASSED WATERWAY

CROPS BMP #14

Photo courtesy of Creative Commons

Description:

A natural or constructed channel, usually broad and shallow, covered with erosion-reducing grasses, used to safely carry surface runoff water from a field, terrace, diversion, or other area to a suitable outlet.

AWQA Minimum Requirements:

Maintain a drainage way by grading and shaping a smooth, bowl-shaped channel and seeding it with sod-forming grasses. This grass cover protects the drainage way from gully erosion and acts as a filter to absorb some of the chemicals and nutrients in runoff water. Adequate vegetation and proper width of grass areas must be maintained to meet this objective.

Recommendations:

Check for high water table soils and seepage areas to determine the need for tile drainage along waterways.
